Seed veſſels firſt appear in white longiſh dots on the under ſide of the lobes, two or three on each ſide the nerve, placed obliquely; when the ſeeds are ripe the veſſels burſt, enlarge, and joining each other at their margins cover the central part of the diſk, the margins only being uncovered.

There is a variety with ſmall leaves taken notice of by Mr. Ray in 3d ſyn. p. 123.

Wallrue Maiden-Hair grows from the chinks of dry rocks in the North of England, and on the mountains of Wales abundantly; on rocks in the Eves near Heptonſtall; on Sowerby Bridge, two miles from Halifax. The leaves grow firſt horizontally, then curve gradually upwards.
